The present invention relates to a process for remote authentication	of a user (7) for
local access to a local machine (4) of a network (5) having a server (3) made	naged by an
administrator (8). The local machine (4) creates a challenge (D) which is c	communicated to
the administrator (8), together with elements known by the user via commu	inication means (9)
independent from the network (5). A predetermined calculation is perform	ed by means of the
server (3) in order to obtain a first response (RD) to the challenge (D). The	e response (RD) is
first transmitted to the user (7) obtained through the communication means	(9). A calculation
is performed by means of the local machine (4) in the same way as the serv	er (3) in order to
obtain a second response (RD1) to the challenge (D). The first and second	responses (RD)
and (RD1) and the local connection are authorized based on the result
